                                                                                                                                                                                                                                                                                                                                                                                                                           ABP79054 standard; Protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic acid sequence is useful in the detection and/or amplification nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent W0200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoe infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                                                                                                                                                                                                                                                                                                                            Human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB4240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         include: cytostatic; proliferative; vulnerary; immunomodulator;

Its amino acid sequence was deduced from a human cerebellum cDNA clone (see AAT89194). Muty polypeptides can be expressed in transformed host cells. The polypeptides can be expressed in concoding them, can be used e.g. to repair oxidative damage to DNA, to prevent mutations from oxidative lesions, to treat genetic diseases

The MYH polypeptide can be used for diagnosing cancer, where the decreasing levels of the polypeptide are measured in a sample from a patient.

                                                                                             The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for ralsing specific antibodies, identification of L. monocytogenes and related organisms, and for blosynthesis and biodegradation, especially biosynthesis of Vitamin 112. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Buchrleser C, Frangeul L, Couve E, Rusniok C, Fsihi H, Dehoux Dussurget O, Checouani F, Nedjari H, Glaser P, Kunst F, Cossar Daniels J, Goebel W, Kreft J, Kuhn M, Ng E, Vazquez-Boland JA; Dominguez-Bernal G, Garrido-Garcia P, Tierrez-Martinez A, Amend Chakraborty T, Domann E, Hain T, Berche P, Charbit A, Durant L Perez-Diaz J, Baquero F, Garcia Del Portillo F, Gomez-Lopez N, Maduenio E, De Pablos B, Wehland J, Kaerst U, Entian K, Hauf J

                   C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AN234584-X35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
especially where the vector directs the expression epitope of {\tt C.} pneumoniae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           synthesis of chimeric proteins comprising a DNA mutation-binding protein, a linker and a nuclease, by recombinant technology. The chimeric proteins are useful for detection, quantification and mapping of DNA sequence variations including mutations, for example, caused by damage and mismatches. The proteins are able to bind to the site of the DNA mutation and cut it out of the molecule. This is used in the invention include cancer and other diseases. The proteins used in the invention include human XPF (or ERCC4), human xeroderma pigmentosum complementation groups A, C and E (XPA, XPC and XPE), human MutS homologue 2 (hMSH2), Serratia marcescens nuclease (Nuc), Thermus thermophilus MutS, Escherichia coli Fapy-DNA glycosylase (Fpg), uracil DNA glycosylase (MutY), synthetic T4 endonuclease V (T4 endo V), endonuclease and accountineases.
                                                                                                                                                                  19-OCT-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         endonucleases and exonucleases.

CC MutY can be used to vaccinate patients and raise an immune response against S. pneumoniae by administration of the protein. MutY protein may CC also be applied to implanted devices, wounds or skin to protect against CC or treat S. pneumoniae infections. Administration of mutY polypeptide or the gene will also protect against H. pylori infection which causes CC diseases such as stomach cancer, ulcers and gastritis. Antagonists of CC mutY may be administered to inhibit mutY in an infected individual. CC Diseases such as meningitis, pneumonia, endocarditis, conjunctivitis and CC sinusitis may be diagnosed by detection of mutY gene in an individual by CC RT-CCR, or detecting mutY in a cell sample from a patient. The new mutY protein is expressed by S. pneumoniae at specific stages of infection. It is important for bacterial viability as it contributes to the removal of CC oxidized guanidines from the genome, which can cause mismatches and CC mutations. MutY and the sequences encoding it can therefore be used to CC diagnose or prevent bacterial infections without the use of antibiotics.

                                                                                                                                                                                                                                                                                                                                                                                                        CC streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS C (Streptococcus/GBS (Streptococcus/GAS C (Streptococcus/GBS), given in CC (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in CC the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and CC antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a CC biological sample. (I) is used to detect Streptococcus in a CC biological sample. (I) is used to determine whether a compound binds to CC (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by CS treptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity corrections profeins and distinguishing/identifying corrections.
                                                                                                                                                                                                                                                                                                                                      Matches

The specification describes a human MYH (hMYH) CDNA and protein. The MYH polypeptide of be used for diagnosing cancer, where the decreasing levels of the polypeptide are measured in a sample from a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

                                                                                                                                                                      streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS

(Streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS

(Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in

the specification. The proteins have antibacterial and antiinflammatory

activity. (I), nucleic acids encoding (I), ABN66044-ABN71536 and

antibodies that bind (I) are used in the manufacture of medicaments for

the treatment or prevention of infection or disease caused by

Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

Nucleic acids encoding (I) are used to detect Streptococcus in a

biological sample. (I) is used to determine whether a compound binds to

(I). A composition comprising (I) or a nucleic acid encoding (I), may be

used as a vaccine or diagnostic composition. The disease caused by

Streptococcus that is prevented or treated may be meningitis. Nucleic

acid encoding (I) may be used to recombinantly produce (I) and may be

used in gene therapy. Antibodies to (I) are used for affinity

chromatography, immunoassays, and distinguishing/identifying

    AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           204
```

The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or

```
cc which are the nucleic acid cited above or fragments between nucleotides cc which are the nucleic acid cited above or fragments between nucleotides cc and the sequence not defined in the specification, for amplifying a cc target sequence contained within a Streptococcus nucleic acid sequence. Cc where the first primer is substantially complementary to the target complement of the target sequence, and where the parts of the primers cc complement of the target sequence, and where the parts of the primers cc having substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound cc with the protein, and determining whether the test compound the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, cc medicaments for treating or preventing a disease or infection due to streptococcus bacteria, particularly s. pneumoniae, such as pneumonia, stepsies, otitis media or ear infection. They are also useful in developing calentifying immunodominant proteins. The methods are useful for the 1469 proteins expressed by the identified coding regions from the calendaric sequence.

"Nucleotide sequence of the Escherichia coli micA gene required A/G-specific mismatch repair: identity of micA and muty.";
Bacteriol. 173:1902-1910(1991).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    OXOGUANINE.

COFACTOR: BINDS A 4FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE CATALYTIC ACTIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE POSITIONLING OF THE ENZYME ALONG THE DNA STRAND.

SIMILARITY: BELONGS TO THE NTH/MUTY FAMILY.
                                         proteome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        complete genome sequence of Escherichia coli K-12.";
